Microplastics in human stool

Scientists detect microplastics in every human stool sample collected in eight countries, call for further research to better understand influence on gastrointestinal health

🕒 October 23, 2018 👤 Ksenia Groh ⌚ Reading time: 2 minutes

In an article (<https://cosmosmagazine.com/biology/microplastics-found-in-human-stools>) published on October 23, 2018, by *Cosmos Magazine*, reporter Nick Carne informed about a study looking at microplastics in human stool, led by Philipp Schwabl from the Medical University of Vienna, Austria. The preliminary results (<http://www.professionalabstracts.com/ueg2018/iplanner/#/presentation/819>) from this study will be presented on October 24, 2018 (<https://www.professionalabstracts.com/api/iplanner/?conf=ueg2018&model=sessions&method=get¶ms%5bsids%5d=217¶ms%5bpids%5d=811,812,813,814,815,816,817,818,819¶ms%5bf>) at the United European Gastroenterology Week (<https://live.ueg.eu/week/>).

So far, the scientists found microplastics "in every stool sample tested from participants in eight countries, with nine different types of plastic identified." On average, feces contained 20 microplastic particles per ten gram, with polypropylene (PP) and polyethylene terephthalate (PET) polymers detected most often. The monitored countries included "Finland, Italy, Japan, the Netherlands, Poland, Russia, the UK and Austria."

Schwabl emphasized that "the highest plastic concentrations in animal studies have been found in the gut" and "the smallest microplastic particles are capable of entering the blood stream." Therefore, "the first evidence for microplastics inside humans" should be followed by "further research to understand what this means for human health," and "especially [for] patients with gastrointestinal diseases."

In a commentary (<https://www.nytimes.com/aponline/2018/10/23/world/europe/ap-eu-austria-microplastics-study.html>) published on October 23, 2018, in *The New York Times*, Martin Wagner from the Norwegian Institute of Science and Technology, Trondheim, Norway, said that the Austrian study is "small scale and not at all representative." He was particularly concerned that "the authors did not provide details about which measures were taken to prevent samples from becoming contaminated." The study authors informed that they "plan to submit a detailed study for independent review in the coming months."

ABOUT US

The Food Packaging Forum enables stakeholders to make better decisions by applying the latest science on chemicals in food contact materials and on the environmental impacts of food packaging. Through its independent, balanced, and science-based publications and tools, the Food Packaging Forum contributes to protecting human and environmental health.
